Warehouse Efficiency: Stock Turnover vs. Shipping Time

Key business insight:

East warehouse holds the largest inventory while showing the lowest stock turnover, making it the strongest candidate for inventory reduction or warehouse downsizing. However, inventory should not simply be transferred to South, which is already operates at the highest capacity utilization. Any consolidation strategy should therefore consider both inventory efficiency and available warehouse capacity.

SALES & CUSTOMER ANALYSIS

Monthly Revenue Trend

Total Revenue by Year Month

Top 10 Customers by Revenue

Top 10 Products by Revenue

Top 10 Customers by Number of Orders

Key findings:

- **Customer:** Euro+ Shopping Channel generates the highest revenue and places the most orders. However, revenue and order frequency are not necessarily driven by the same customers. For example, a customer could have: relatively few orders but very high revenue per order, OR many orders but relatively lower revenue per order.
- **Product:** 1992 Ferrari 360 Spider red is the highest-revenue product in the current dataset.
- **Seasonality:** Revenue picks in November, indicating a notable seasonal pattern in sales.

INVENTORY & PRODUCT PERFORMANCE

» Quick measure

Product Inventory vs. Stock Turnover

Inventory by Warehouse & Product Line

10 Fastest-Moving Products

10 Slowest-Moving Products

Slow-moving inventory: A number of products have very low or even zero stock turnover despite holding inventory, highlighting potential candidates for inventory reduction or further review.

Fast-moving products: Products with high stock turnover move through inventory much more efficiently and should be monitored carefully to avoid stock shortages when optimizing inventory levels.

Warehouse implications: The combination of high inventory and low turnover supports the earlier finding that the **East warehouse is the strongest candidate for inventory reduction or downsizing**. However, inventory redistribution should consider product demand and the available capacity of the other warehouses.

WAREHOUSE OPTIMIZATION & RECOMMENDATIONS

Warehouse Performance Scorecard

Warehouse Name	Current Inventory	Stock Turnover	Average Shipping Days by Warehouse	Warehouse Capacity %
East	219183	0,16	3,8	67 %
North	131688	0,19	3,8	72 %
South	79380	0,28	3,9	75 %
West	124880	0,18	3,6	50 %
Total	555131	0,19	3,8	66 %

Key recommendation:
East -> reduce/downsizing (strongest candidate)
West -> potential capacity
South -> monitor capacity

Warehouse Capacity vs. Shipping Time

Warehouse Capacity %, Average Shipping Days by Warehouse and Current Inventory ...

Recommended warehouse strategy:

- **Prioritize East for inventory reduction / downsizing**
East holds the largest inventory (219K) while having the lowest stock turnover (0.16), indicating relatively inefficient inventory movement.
- **Redistribute selectively, not automatically**
Inventory removed from East should be redistributed based on product demand, warehouse capacity, and shipping performance rather than simply transferred to the warehouse with the highest turnover.
- **Use West as a potential redistribution option**
West currently operates at the lowest capacity utilization (50%) and has the fastest avg. shipping time (~3.6 days), suggesting comparatively more available capacity and efficient shipping performance.
- **Monitor South carefully**
South has the highest stock turnover (0.28), but also the highest capacity utilization (75%) and longest average shipping time (~3.9 days). Its strong inventory efficiency should therefore be balanced against its limited capacity.
